0K2D57ECS
New generation digital display closed loop stepper driver
1.Product introduction
1. Overview
OK2D57ECS is a new closed loop stepper driver developed by our company based on more than ten years of stepper and servo R&D experience. It can used to drive NEMA 23, NEMA 24 closed loop stepper motor. It adapts the latest ARM chip and applied vector closed-loop control algorithm to completely overcome the loss of open-loop stepper motors. At the same time, it can significantly improve the high-speed performance and torque output of the motor, and reduce the heating and low-speed resonance problems of the motor. In addition, when the motor is continuously overloaded, the driver will output an alarm signal, which has the same reliability as the AC servo system. The traditional stepper drive solution is easy to
continuously overloaded, the driver will output an alarm signal, which has the same

2. Performance parameters

which is only equivalent to 30-50% of the traditional AC servo system.

• Built-in microcontroller function can replace PLC in most occasions significantly reducing user costs.;

- Internally supports jog mode, open-loop/closed-loop option functions.
- Built-in smoothing filter function, external input can operate normally

without acceleration or deceleration;

- Adopts a new 32-bit motor control dedicated ARM smart chip;
- ♦ 4-digit LED digital tube display with 4 button operations, intuitive and easy to operate.;
- Adopt advanced vector current, speed and position closed-loop control algorithms;
- The current can be set arbitrarily (within the range of 0---6A);
- The standard motor comes with a 1000-line high-precision photoelectric or magnetic encoder.;
- Optocoupler isolation differential signal input, pulse response frequency up to 200KHZ.;
- Arbitrary microstep setting (200-60000) to meet all occasions;

It has protection functions such as overcurrent, overvoltage, overspeed, overheating, and excessive tracking error;

3. Application:

Suitable for various small and medium-sized automation equipment and instruments, such as: engraving machines, wire stripping machines, marking machines, cutting machines, laser phototypesetting, plotters, CNC machine tools, automatic assembly equipment, etc. Particularly adapt to the applications desired with low noise, low heating, high speed and high precision.

3. Mechanical Specifications: (unit: mm [1inch=25.4mm])

4. Methods of quick heat dissipation

(1) The reliable operating temperature of the driver is usually within 60°C, and the operating temperature of the motor is within 80°C;

(2) When installing the driver, please install it upright on its side to form strong air convection on the surface of the radiator. If necessary, install a fan close to the driver to force heat dissipation to ensure that the driver operates within a reliable temperature.

3.Introduction to driver interface and wiring

1. Interface definition

2. Control signal interface circuit diagram

Control signal input and output interface circuit diagram, as shown in the figure.

(1) Input signal connection

Common anode connection method

Common cathode connection

Special note: This driver supports 5V-24V and

does not require a series resistor!

(2) When using differential input, please wire as shown below.

Pic 3(a) Differential mode control signal interface wiring diagram

3. Control signal timing diagram

In order to avoid some malfunctions and deviations, PUL, DIR and ENA should meet certain requirements, as shown in Figure 4 below:

Picture 4 Timing diagram

Note:

- (1) t1: ENA must be ahead of DIR by at least 5ms. Usually, ENA+ and ENA- are NC (not connected).
- (2) t2: DIR must be ahead of PUL effective edge by 5ms to ensure

correct direction;

- (3) t3: Pulse width not less than 2.5ms.
- (4) t4: Low level width not less than 2.5ms.

4. Introduction to drive status indicators

1. Fault description

Number	Error code	Fault description	Troubleshooting
*** 0*** 0*** 0* *** 0*** 0*** 0*	Er01	hardware malfunction	Need to return to factory for testing
2	Er02	Motor overcurrent	Check whether the motor is short-circuited or reduce the current
3	Er03	Drive overvoltage	Check whether the input voltage is too high
4	Er04	Driver undervoltage	Check whether the input voltage is too low
	Er05	Location out of tolerance	The motor is overspeeding, increase the current and voltage appropriately.

2. Parameter monitoring instructions

PIN	Function code	Function Description	Function introduction
*** 0** <u>1</u> 0*** 0*	L-00	Speed	Monitor the current speed,
200	L-01	Voltage	voltage, and current to check
3	L-02	A phase current	whether the drive is working
4	L-03	B phase current	normally and resolve any

¹⁵ Q ¹⁹¹⁵ Q ¹⁹¹⁵ Q ¹⁹¹⁵ Q	ny Ony Ony Ony On ny Ony Ony Ony On	- 0 ar 0 a	abnormalities in time!
5	L-04	Following error	
6	L-05	Number of received pulses	Check the number of received pulses in real time to determine
7	L-06	Motor feedback pulse number	whether the motor has lost step.
8	L-08	Software version number	The bigger the number, the newer the version

Note: L-01 What is displayed is the DC voltage inside the driver;

3. Description of commonly used function codes

Number	Parameter settings	Function code	Function Description
	Number of subdivided pulses	P-00	200-60000 can be set at will, factory default setting is 1600
2	Closed loop holding current	P-01	1.0-6.0, factory default 2.0A
3	Jog operation	P-06	Enter into JOG, Press 🛦 🔻 Jog
	Motor direction	P-12	0 reverse, 1 forward
2 ⁰¹² 0 ⁵² 0 ⁰¹² 0 2 ⁰¹² 0 ⁰¹² 0 ⁰¹² 0 ⁰¹²	Reset	S-20	Set to 1 to restore factory settings

5.Driver button parameter settings:

The driver's operation panel consists of 4 LED digital displays and 4 buttons M, \blacktriangle , \blacktriangledown , and \triangleleft , which are used to display various system status, parameter settings, etc.

	Button function description table								
Button	Function Description								
M	Function selection: P parameter, S parameter, L parameter switching								
	When the value changes: +1, long press to increase quickly. In jog mode: press and hold the motor to rotate forward								
	When the value changes: -1, press and hold to quickly reduce. In jog mode: press and hold the motor to reverse								
	 Press and hold this button for 0.5 seconds to enter parameter setting When setting parameters, press once and shift to the left once 								
	 3、After the setting is completed, press and hold this button for 0.5 seconds to confirm that the setting is successful and return to the current function code. 4、 In case of a fault, press and hold this button for 2 seconds to reset the fault. 								

After the driver is powered on, the enable display is run, indicating that the motor is powered on and the driver is working normally. When the motor enable is turned off, stop is displayed.

Complete parameter menu:

The driver provides 2 sets of parameters for user operation. The P parameter is used to set several general parameters of the driver. Parameter value (such as microstep resolution, lock current, motor type, etc.), S parameter is used to set the performance parameter index value of the driver.

Parameter	Name	Name Parameter Factory range default

	Current loop proportional gain P	1~32000	1500	The larger the setting value, the higher the gain and the greater the					use the factory parameters and do not modify them at will.

S-20	Reset	0~1	0	Restore factory	settings
0 ²²⁵ 0 ²²⁵ 0 ²²⁵ 0 ²²⁵			0 ⁰⁰² 0 ⁰⁰² 0 ⁰⁰	after setting to 1	0 10 ¹² 0 10 ¹² 0 10 ¹²

Special note: The driver's factory default current loop parameters, position loop parameters, etc. are the optimum parameters for the matching motor, and customers generally do not need to modify them. If the customer's application environment is special, the parameters with * can be modified under the guidance of professionals to achieve the best use results.

After setting the function, power off and restart is required! Case 1: The user starts and stops quickly, brakes suddenly, and the motor shakes unstable when stopped. Set S-05 to 2000 and S-07 to 400 to achieve satisfactory results!

6. Power supply precautions

The DC input voltage is DC24V~50V, and the power supply power is not higher than 150W. The higher the voltage input and the larger the current setting, the greater the motor torque and the better the high-speed performance. However, the motor generates more heat. In principle, as long as it meets the use, the smaller the current setting. The better.

Please note:

1) When wiring, pay attention to strictly follow the colors of the motors;

2) The driver must not be connected to 220V. The driver is DC, so pay attention to the direction;

3) The encoder power supply is provided by the driver and does not need to be powered separately;

4) The control signal wire and the motor phase wire cannot be entangled together, and it is better to add a shielding layer to the signal wire;

7. Open loop and closed loop settings

This driver is a closed-loop driver can drive Nema 34 (86 x 86) stepper motor which must be equipped with a 1000-line encoder. The motor's operating performance can be greatly improved by more than 30% compared to open-loop.

When an unexpected situation occurs, such as encoder failure or poor contact of the encoder line, you can set P-18 to 0 (need to power off and restart) and turn on the open-loop mode to solve customer problems to the greatest extent.

8. Brake control settings

When the motor is braked, the brake signal is controlled by the ALM alarm output pin.

Set P-11 to 1, P-85 power-on brake release delay time, P-86 alarm power-off delay time!

Press and hold left arrow to save

Wiring method for motor with brake:

Since the brake coil will generate a relatively large surge current when it operates, if the brake coil is directly connected to the output port of the driver, the optocoupler at the driver output port will be damaged, so a relay must be used as a relay control. Since the brake coil and relay are both inductive loads, it is recommended to add a freewheeling diode. Do not connect the diode in the opposite direction when wiring.

It is recommended that customers choose solid-state relays, then you don't need to use freewheeling diodes. The advantages of solid-state relays are: fast response, no need for freewheeling diodes, and no sound when powered on.

The wiring of the brake and relay is as shown below:

9. Microcontroller-multi-segment setting instructions

Multi-segment position means that the driver stores 8-segment position instructions internally, and the displacement, maximum operating speed, and acceleration and deceleration time of each segment can be set separately. The waiting time and connection method between each section can also be selected according to actual needs.

The time interval between each group of positions is determined by P-66~P-73, and

the number of cycles is determined by P-49. If the time interval is 0, it will switch to the next group of operations when the speed is the highest. If P-49=0 at this time, the cycle will continue. If you need to trigger the operation through the input terminal each time after the multi-segment setting is completed, instead of running according to the set time interval, please set P-19 to 1.

User parar	neters	Location command source
P-09	0	Multiple location settings

User para	meters	Location command source
	0	Segment continuous running mode, trigger once and execute everything
P-19	1	Segment single trigger mode, trigger once and execute a segment sequentially

Multi-position position external input trigger mode selection.

11、 Speed mode

Speed mode is mostly used in the precision CNC machining industry. Users can select the mode through P-09 and make different settings according to different occasions.

User parameter settings

Digital setting refers to storing the set speed value through function code P-93 or P-94 or P-95 and using it as a speed command.

(1) Digital given speed mode

There are two application methods for digital given speed mode: the first is for the user to set different speed command values in the P-93 or P-94 or P-95 function code before making an action, and then pass the pulse, Direction The terminal performs speed switching; the second is to use communication methods to change the value of the function code.

A: User related parameters

User parameters		Speed command source			
P-09	2	Digital given			
	Speed command	Speed command keyboard setting value 1			
P-93	Predetermined area	Set unit	Factory default	Effective method	
	0~±4000	r/min	100	Effective immediately	
P-94	Speed command keyboard setting value 2				
	Predetermined area	Set unit	Factory default	Effective method	
	0~±4000	r/min	200	Effective immediately	
0 ¹⁰¹² 0 ¹⁰¹² 0 ¹⁰¹²	Speed command keyboard setting value 3				
P-95	Predetermined area	Set unit	Factory default	Effective method	
	0~±4000	r/min	300	Effective immediately	

B: Input signal setting, use the following input signals to switch the operating speed.

Signal name	Name	Function
Digital given speed selection 1	Pulse terminal	Digital given speed
Digital given speed selection 2	Direction terminal	selection

C: Digital given speed operation

Pulse terminal	Direction terminal	
OFF •	OFF •	0: Zero speed
OFF of	ON	P-93: Setting value 1 speed
ON	OFF	P-94: Setting value 2 speed
ON	ON	P-95: Setting value 3 speed

If external terminals are not needed, it will run automatically after power-on. Set P-96 to 1, and then the speed at this time is specified by P-93.

Command ramp function settings

The ramp function control function refers to converting a large-changing speed command into a relatively smooth constant acceleration and deceleration speed command, that is, by setting the acceleration and deceleration time to achieve the purpose of controlling acceleration and deceleration. In the speed control mode, if the given speed command changes too much, the motor will jump or vibrate violently. If the acceleration and deceleration time of the soft start is increased, the motor can start smoothly and avoid the above situation. Mechanical parts are damaged.

User parameter settings

	Acceleration time				
P-89	Predetermined area	Set unit	Factory default	Effective method	
	1~30000	ms of a	200	Effective immediately	
²¹¹ 0 ²¹¹ 0 ²¹¹ 0	Deceleration time	0 ¹¹² 0 ¹²² 0 ¹²² 0 ¹²² 0	ny Ony Ony Ony Ony Ony O	ar our our our our o	
P-90	Predetermined area	Set unit	Factory default	Effective method	
	1~30000	ms of a	200	Effective immediately	

S-curve smoothing function

During the acceleration and deceleration process, since acceleration and deceleration changes such as starting and stopping will cause impact, it is necessary to add an S-curve acceleration and deceleration command to the speed command, that is, by adding an arc to the acceleration and deceleration slope to make the servo motor run more smoothly.

(1) User parameter settings

¹ 0 ¹¹¹ 0 ¹¹¹ 0 ¹¹¹	S-curve deceleration time

12、 Product warranty terms

1. One year warranty

Our Company warrants its products against defects in materials and workmanship for a period of 12 months from

shipment out of factory. During the warranty period, We will either, at its option, repair or replace products which proved to be

defective.

2. Not covered by warranty

The above warranty does not extend to any product damaged by reasons of improper or inadequate handlings by customer, improper or inadequate customer wirings, unauthorized modification or misuse, or operation beyond the electrical specifications of the product and/or operation beyond environmental specifications for the product.

3. Maintenance process

If it is necessary to repair the product, it will be handled according to the following process:

 $({\bf 1})$ Before shipping, you need to call the agent to obtain the return permit number.;

(2) A written description is attached with the product, explaining the fault phenomenon of the drive being returned for repair; the voltage, current and usage environment when the fault occurred; and the name, phone number and mailing address of the contact person.

(3) Please pay the postage first and send it to the company's location or designated repair point. The company refuses to accept any express freight collect.

4. Warranty limitations

We make no other warranty, either expressed or implied, with respect to the product. We specifically disclaim the implied warranties of merchantability and fitness for a particular purpose. Some jurisdictions do not allow limitations on how long and implied warranty lasts, so the above limitation or exclusion may not apply to you. However, any implied warranty of merchantability or fitness is limited to the 12-month duration of this written warranty.

5. Maintenance requirements

When returning for repair, please fill in the "Maintenance Report" truthfully to facilitate repair analysis.
